THE DOVE CLINIC FOR INTEGRATED MEDICINE

ISSUE 4

November 2010

Special Offer - As part of our 10th Anniversary, book a consultation before 31st December 2010 to receive a 10% discount on your prescribed CFS treatment programme commenced before the end of January 2011.

Reception at The Old Brewery

10th Anniversary Celebrations !

The 1st November saw the Dove Clinic celebrate its 10th birthday. Back in November 2000, the Clinic was launched at Hockley Mill Stables by Dr Julian Kenyon and his wife Tanya, with a staff including Nurse Anne Burnett. Since then patient and staff numbers have grown steadily with the clinic now employing some 20 staff between the Twyford and London clinics. Another milestone is approaching as The Dove will also soon welcome its 5000th patient through the door. We are looking forward to marking that special event too.

The day itself saw long-standing patients joining staff members in a celebratory lunch in the Reception area at The Old Brewery in Twyford, which was festooned with balloons commemorating the event. Julian and Tanya cut the special cake to seal the day. There was a strong buzz during lunchtime as patients and staff exchanged stories and experiences of their time at The Dove Clinic. One patient recalled how he had first met Julian when he practised in Liverpool. Another wondered what would have happened had she not met Julian some years previously. The experience also mixed new with existing patients. It was explained to one lady who had

Heather, Dawn & Chris

arrived for her first appointment that lunch didn't usually precede a consultation at the Dove!

And so The Dove Clinic looks forward to the next 10 years and ponders what changes may be in store during that time. In that time some of the staff will undoubtedly change, but it is sure that the ethos of the Clinic will not.

David Webb.

Chronic Fatigue Syndrome/ME (Myalgic Encephalomyelitis)

ME, also known as CFS (Chronic Fatigue

Syndrome), is a common complaint seen and treated at the Dove Clinic. This condition, which can range from being mildly debilitating to extreme disability, is one that has flummoxed the medical profession for many years and has, in the past, given rise to some pretty unsavoury and damaging Press articles (do you remember 'yuppie flu'?).

In the conventional medical world treatment largely centres on rest, diet and graded exercise and 'pacing', as well as cognitive behavioural therapy. For some patients this has proven successful, but for the vast majority of patients that we see at The Dove Clinic, they have not been

Special Offer - The Dove Clinic is currently making a special offer for anyone considering EECF for angina and chronic heart disease. For £99 you will receive a full doctor's assessment / consultation at The Dove Clinic. For anyone taking a course of treatment, this fee will be discounted from the cost. Please use the code mentioned on the EECF website www.eecp.co.uk

THE DOVE CLINIC FOR INTEGRATED MEDICINE

able to get rid of the symptoms and effects of CFS on their daily lives.

At The Dove Clinic we consider the patient as a 'whole', which means that not only do we look at the symptoms and complaints that the patient presents with, but also the way in which their whole body is working in (or out), of harmony with itself. Those suffering from CFS typically have considerable problems with their gut motility ('leaky gut' syndrome) and experience 'brain fog', along with memory and sleep disturbance. Extreme aching of muscles and joints, as well as excessive tiredness are also common features. All of these things, as well as the patient's diet and lifestyle need to be taken into consideration and sometimes that means thinking laterally and considering other factors, such as the possibility of stealth organisms, viruses, previous overseas travel (resulting in foreign bacteria/bites etc), tick bites (can cause Lyme's Disease) and many other factors.

We are able to carry out a multitude of diagnostic tests and then, when we have as full a picture as possible, can advise treatment that is tailor-made for the individual patient.

Treatment programmes for CFS generally centre on high dose intravenous Vitamin C, with a number

of other nutritional infusions, to help 'detox' the patient's system and rebalance their body. Along with various oral nutritional supplements to

Dr Julian and Tanya Kenyon about to cut the cake

strengthen and enhance the immune system, we have a great deal of success in helping patients recover, either fully or partially, from their condition. Seeing patients, who have previously been virtually bed-ridden, taking up a near-normal daily life once more and perhaps being able to return to work is a great boost to the staff here who provide the treatment and care.

If you would like more information on CFS

please visit the following www.cfsmedicine.co.uk. For details of the treatment programmes we can offer, or to book an appointment, please contact our reception

team on 01962 718000 or visit www.doveclinic.com

Meeting Customer Needs.

From September we commenced availability for evening appointments. I therefore list below availability for **December:**

Dr Richard Fuller has availability on Tuesday 21st December. **Dr Julian Kenyon** on Thursday 9th. **Please telephone our Reception Team if you would like to have an evening appointment.**

Dr Julian Kenyon has written the following about the Oberon machine which many of you will have experienced at your consultation.

The Oberon device is a spin-off from the Russian space programme that was developed at the Department of Medicine, University of Omsk, Siberia. Most of the Russian scientific effort to support their space programme is based in Siberia.

The device is an unusual biomedical device outside of the current medical paradigm. It is based on 20 years of basic research done by a number of Russian teams who worked out, on normal individuals, patterns of frequency responses that correspond to particular organs. Also, they were able to work out what the normal frequency response would be for any particular age of either male or female subjects of each organ.

The device is used for assessing organ function and not structure. Therefore it is not like an MRI, CT or an Ultrasound scan. It is specifically measuring the magnetic vector potential which, those readers skilled in physics will recognise, as the \vec{A} field which

Special Offer - Introduce a friend and get a £50 voucher to use at your next full consultation. More good news, your friend will also get £50 discount from their first consultation. Make sure you both quote "friend offer" and you will receive your voucher once your friend has attended.

runs in the direction of current. This is at right angle to the B field which cuts the lines of magnetic force at right angles and is what drives an electric motor. Living systems are very sensitive indeed to the \vec{A} field (the magnetic vector potential).

The device involves sitting in front of a receiver with headphones on the head. The relevant frequency patterns are projected through the headphones (these are inaudible as they are well above the audible frequency range). The sensor channels the information which comes off the test subject as a result of having the resonant frequencies passed through the headphones to a computer based device and the readings are shown. Then, relevant medications, which have also had their frequency response determined using the same methods, is titrated against the reading found and as a result, the patient goes away with an optimal set of medications which are most likely to help their current condition.

Therefore, from a practical point of view, this is a method of determining ideal medication and is not fundamentally a diagnostic device. For example, it cannot diagnose whether a life threatening condition is present or not.

I have carried out a study of 100 patients with known pathologies (mostly patients with life threatening conditions) and tried to correlate

these with the Oberon readings.

In spite of that, this is not a device for diagnosis of life threatening conditions.

The idea of frequency response being relevant in medicine has been given considerable scientific support by a range of recent research projects being carried out around the world. One team led by Alexandre Barbault from Switzerland, reported on his study using amplitude-modulated electromagnetic fields in the treatment of cancer. He found tumour specific frequencies, these were large groups of frequencies, and then went on to assess a novel therapeutic approach based on his findings. This was published with

several co-authors in the Journal of Experimental Clinical Cancer Research in 2009. He has been treating a number of late stage cancer cases who have failed all modalities of treatment, who were maintained with stable disease using Barbault's approaches; that is simply exposing the patient to a highly complex set of frequencies determined by painstaking measurements made on the subjects. Additional to this work there are projects being developed by a company called Novocure, a company based in Haifa, who are using groups of resonant frequencies applied over brain tumours of patients with glioblastoma multiform, which is the most malignant of all brain tumours. This company has been able to establish significantly increased survival of patients treated in this way, simply with a probe and electrode placed on the scalp over the tumour, compared to standard treatment approaches. What is more, this company has significant investment from several major pharmaceutical companies.

The readings shown by the Oberon equipment have more in common with a traditional Chinese medicine view of the way the body works, which is very much based on organ function, as opposed to a standard biomedical model, which is based more on structure. Integrating these conventional and non-

conventional approaches, which is what we do in the consultation situation, we have found to be most helpful from a clinical point of view.

It is possible to conceive that with additional interest and research along the lines of the studies mentioned that these approaches may increasingly attract the interest of mainstream medicine.

Dr Julian Kenyon

Alva Cosmetics.

Alva is the first German manufacturer of natural cosmetics that adheres to the strict Ecocert guidelines for the field of skin care and cosmetics. The entire make up line is certified by Ecocert.

We are making available to our patients with allergies and those who are unwell and fear reactions to mainstream cosmetics, make-up that has been specially formulated for people with sensitivities.

We have a brochure and price list which we can send you if you are interested.

Please contact me at The Dove Clinic or email me if you would like a brochure. Val.Hallett@doveclinic.com
