

Dermatology and Photodynamic Therapy

We have a skin cream made with a photodynamic agent (photoflora). This combined with light bed treatment as per our PDT for cancer patients (see Next Generation PDT on this website) is an effective method of treating:

Acne

Psoriasis

Warts

Herpes (oral and genital)

Leukoplakia

Rodent ulcers

Actinic keratoses

There is an extensive evidence base to support the use of photodynamic therapy in these skin conditions.
